

10 Steps Towards Developing Evidence Based Best Practice in Night Time Residential Care

INGRID EYERS

CRaNe

Care Research Network

dr.ingrid.eyers@gmail.com

Sleep is vital to our wellbeing

Importance of Sleep in Later Life

Sleep is restorative

Enhances cognitive abilities

Enhances physical abilities

Contributes to recuperation and rehabilitation

Reduces the risk of falls

Enhances quality of life

Why research sleep in care homes?

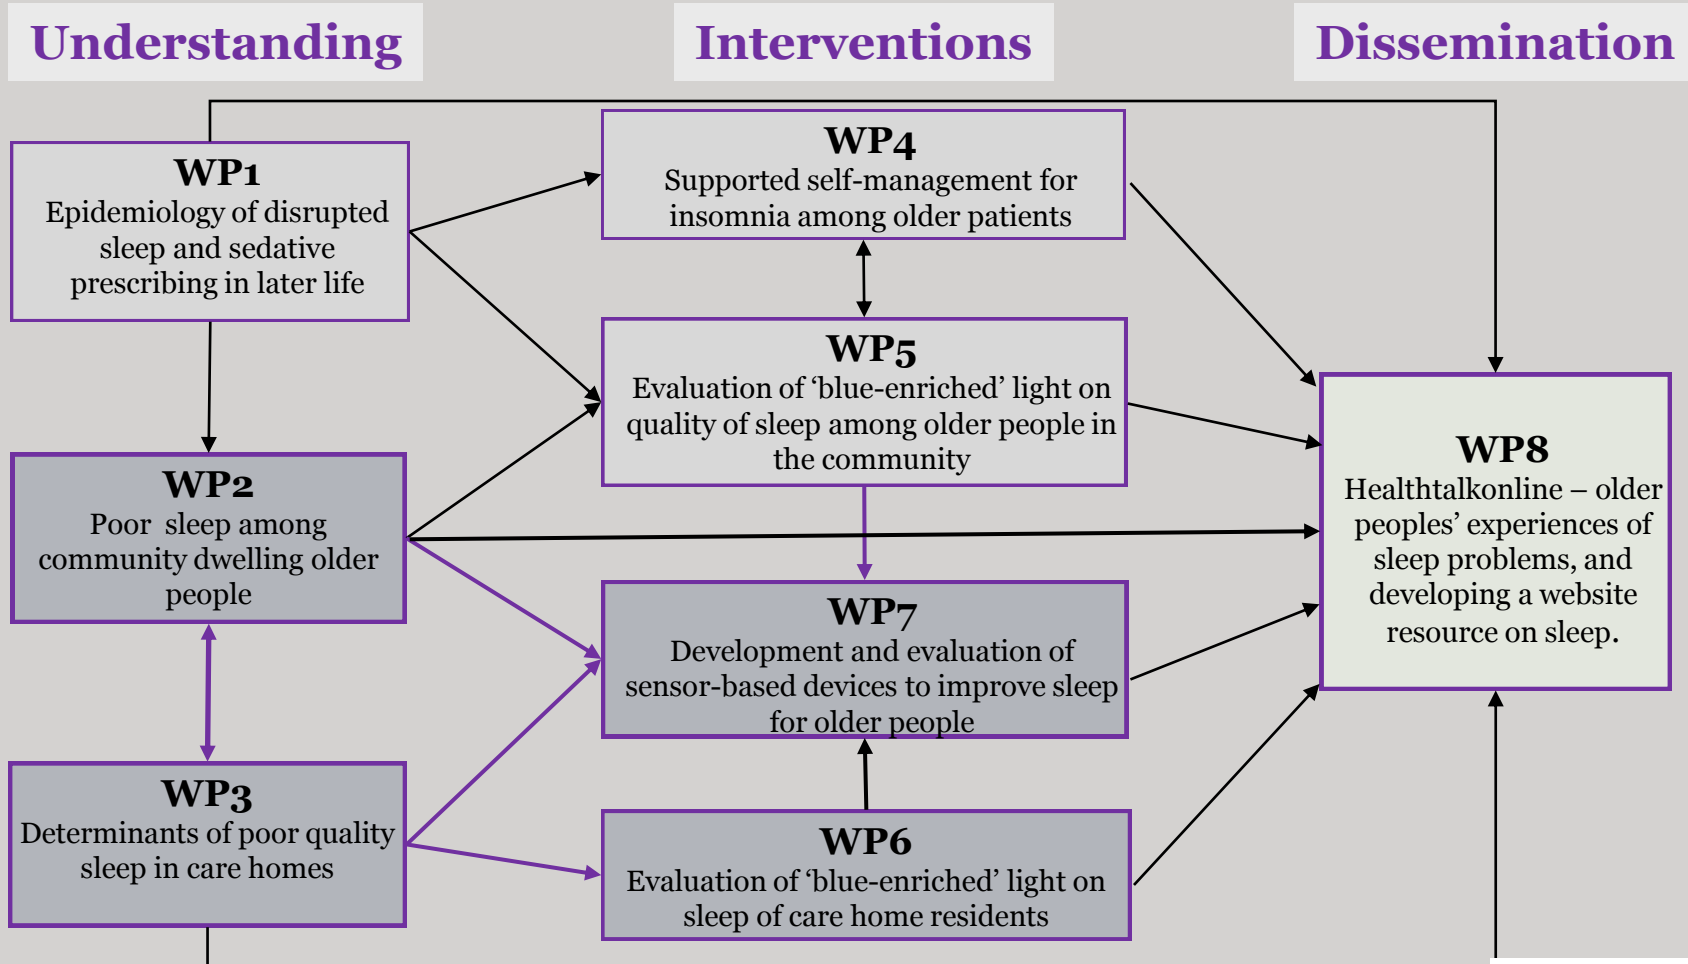

Sleep forms a significant part of the everyday life experienced by older people living in nursing homes and may dominate their lives

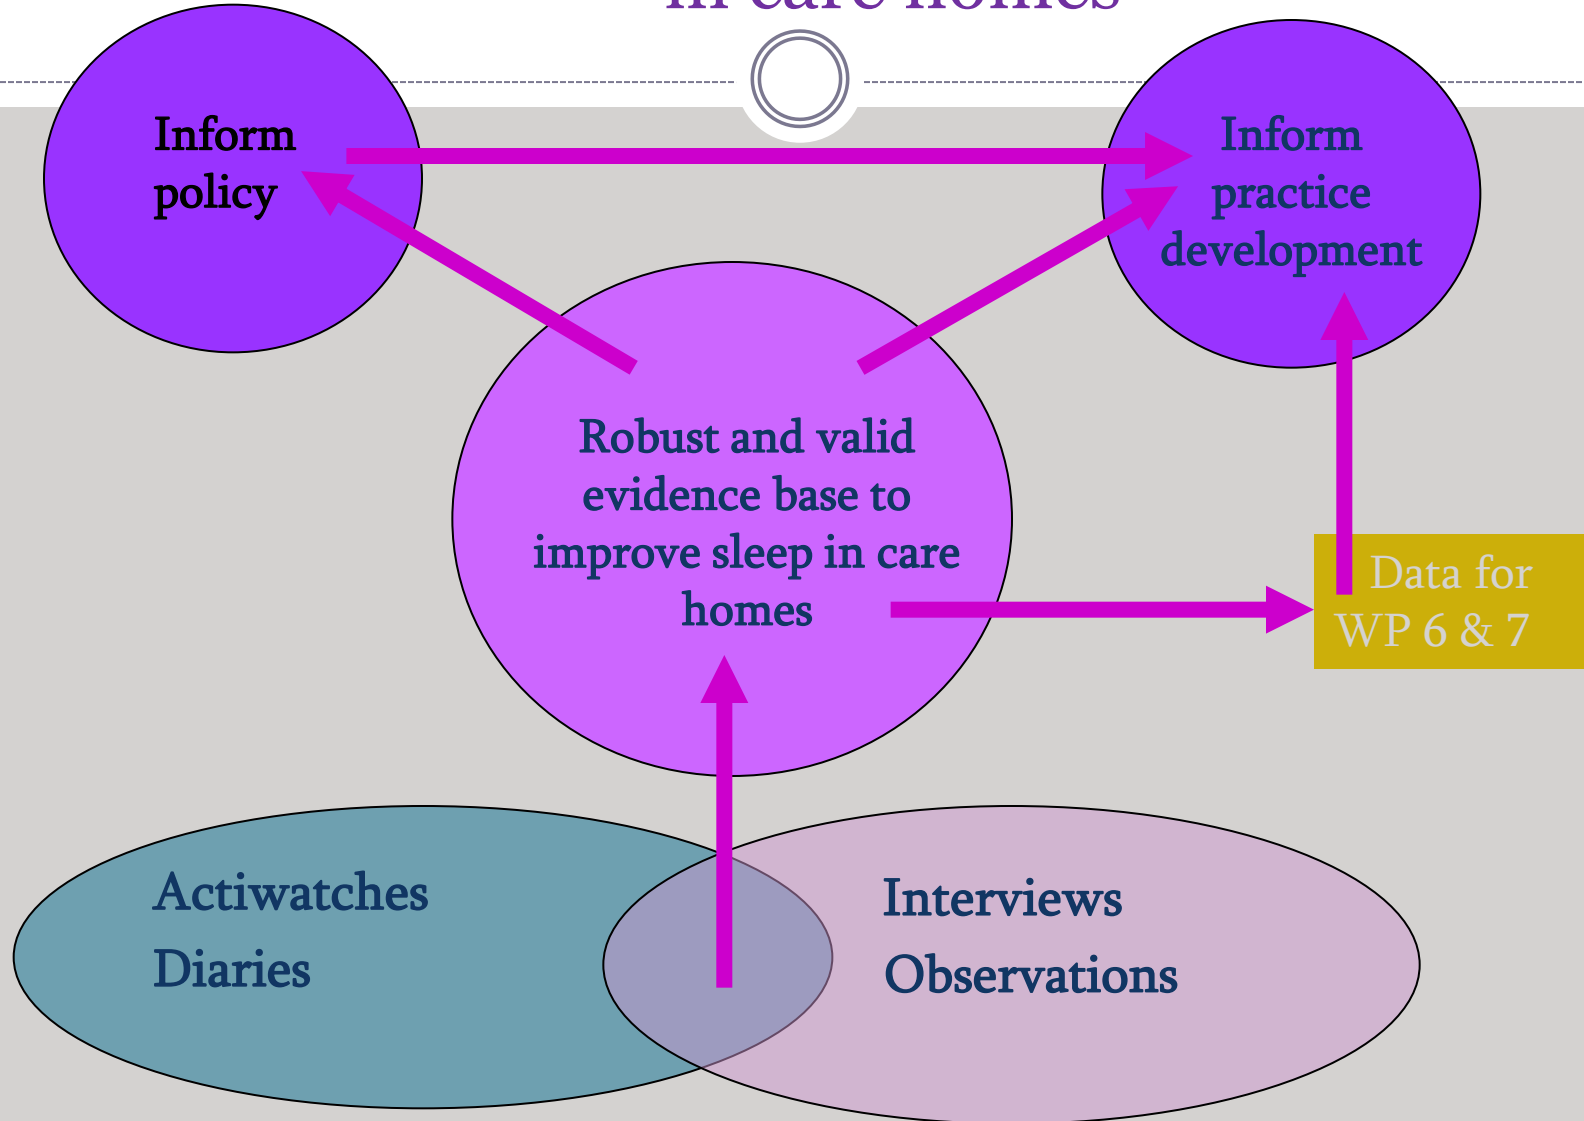

Getting residents ready for sleep, monitoring sleep and getting residents up in the morning are key to the support in activities of daily living provided by care staff

The experience of sleep in nursing homes can be expected to differ from that of sleep 'at home'

Establishing the evidence base: The SomnIA Work Packages

Identifying the determinants of poor sleep in care homes

Actigraphs

Night-time waking and light exposure
(e.g. continence care)

Day time activity and light exposure

Determinants of poor sleep in care

Key findings (quantitative data):

Mean time in bed 10hours 47minutes

64.8% of sleep disturbances were related to toilet/continence care

83.3% of residents experience fragmented sleep

Determinants of poor sleep in care

Key findings (qualitative data):

Conflict between staff and residents as surveillance and care giving processes disrupt sleep

‘...Checking on them... that’s our work, we have to look after them’ (*Madge, care staff*)

‘When the staff come into my room I wake up’ (*Stanley, resident*)

Research to Practice: Workshops

10 Steps Towards a Good Night's Sleep for Older People Receiving Care

Dr. Ingrid Eyers

These steps are built on the foundation of New Dynamics of Ageing funded Scania research project (RES-239-25-0009) and received the International Association of Housing and Services to the Ageing Award for Excellence in Research 2013

For further information or to become a 'sleep mentor' and improve the quality of life experienced by older people receiving care contact CrAve: info@crave-net.eu or visit our website: www.crave-net.eu

Sleep well and you live well. But many older people receiving care do not sleep well. These 10 Steps can have a positive influence on getting a good night's sleep and can help improve the quality of life experienced by older people receiving care.

1. Understand the importance of uninterrupted sleep
2. Support daily access to natural light and fresh air
3. Ensure exposure to good lighting throughout the day
4. Consider the fact that the night does not begin at 6pm
5. Offer social activities after 6pm
6. Accommodate individual bedtime habits of a lifetime
7. Establish the differing needs of 'larks' and 'owls'
8. Aim to provide night time care plans that facilitate uninterrupted sleep
9. Aim to provide night time care plans that facilitate uninterrupted sleep
10. Ensure uninterrupted sleep is possible between 11pm and 7am

Development in Practice: Small Group Experience

12 bed unit was selected for trial in a rural setting in Western Australia's beautiful south west wine growing region

Strategy

Nurse Practitioner reviewed all residents with a view to de-prescribing with their regular GP

Resident and family meeting were held regularly during the process to keep people informed and for opportunities for questions

A plan for implementation was commenced

Staff Education

- Care staff and clinical staff attended education with a sleep specialist
- Unfortunately funding was not approved for the project
- Innovative ideas were given a green light

Settling Routine

- Later dinner – 6.30
- Staff changed into slippers and dressing gowns
- Supperclub with high calorie snack

Getting to Sleep

- All residents were reviewed by continence advisor
- Chronic health assessment by Nurse Practitioner
- 5 day sleep assessment
- Pain assessment

What were care staff concerned about?

- What if we don't check?
- What about pressure injuries if we don't turn people?
- What if someone falls?

Solutions

- Resident and family meetings
- Staff were informed of the evidence base
- New mattresses were used where required
- Infra-red monitoring sensors introduced

7 to 8 hours uninterrupted sleep was provided

Outcome:

Sleep improved

Active participation in everyday life improved

Behaviour improved

Reduction in falls

De-prescribing is reported by nurse practitioners to be successful

Residents, their families and staff are happy

Conclusion:

All inclusive approach is needed to improve sleep of older people receiving care. Involve everybody in the quest

Review policy (Inspectorate, Quality Control)

Inform

Educate

Respect the individuality of each older person being cared for

Person centred care continues through the night to improve the day

Include knowledge transfer to practitioners in research funding

**Thank you for listening, please don't forget
your own need for restorative sleep**

www.crane-net.eu/en/publications

Acknowledgement

THANK YOU to everybody who took part especially to Vicki Fitzgerald who at managerial level actively took research into practice

The **10 Steps** are built on the foundation of New Dynamics of Ageing funded SomnIA project (RES-339-25-0009) and are the outcome of wide ranging discussions with the care sector in the process of disseminating the research findings to the care sector at a national and international level
